Prof./Dr. Saraju Mohanty

University of North Texas, USA.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Smart Electronic Systems Laboratory (SESL)

Outline

- Need for Smart Agriculture

- Agriculture → Smart Agriculture

- Factors affecting type of crop

- Technologies used in Smart Agriculture

- Smart Agriculture – Case Studies

- Challenges and Issues in Smart Agriculture

- Smart Agriculture Applications

- Smart Agriculture & FL

- Supply chain- Practical Implementation

- Security and Privacy Challenges in Smart Agriculture

Smart Agriculture - Prof./Dr. Saraju Mohanty

Smart Agriculture – Drivers → The Need

Global Population Explosion

- Global population expected to be 9 billion by 2050 compared current population of 7.8 billion.

- Population → Demand for natural resources → Demand for food

- Need of the Time: Make the agriculture utilize fewer natural resources, increase yield and make the farms climate independent.

The size of the world population over the last 12,000 years

- 7.7 billion in 2019
- 7 billion in 2011
- 6 billion in 1999
- 5 billion in 1987
- 4 billion in 1975
- 3 billion in 1960
- 2 billion in 1928
- 1.65 billion in 1900
- 990 million in 1800
- 600 million in 1700
- 190 million in the year 0
- 4 million in 10,000 BCE

The average growth rate from 10,000 BCE to 1700 was just 0.04% per year

Mid 14th century: The Black Death pandemic in Europe kills 200 million people.

Based on estimates by the *History Database of the Global Environment* (HYDE) and the United Nations. On OurWorldinData.org you can download the annual data. This is a visualization from OurWorldInData.org, where you find data and research on how the world is changing. Licensed under CC-BY-SA by the author Max Roser.

Image Source: https://ourworldindata.org/world-population-growth

World Hunger

- According to world hunger clock, 828 million people are under nourished.

- Controlling population is one way of tackling with raise in demand of food.

- Increase the agriculture production is one more remedy which can reduce World hunger.

Can we Have Any Crop, at Any Place?

- The factors determine the type of crop that can be farmed based on different environmental properties:

  - Climate
  - Elevation
  - Slope
  - Soil
  - Water availability
  - …
  - …

Any Crop, Any Place: Climate

- Precipitation, sunlight, latitude, longitude

- Snow cover, water bodies $\in$ **Climate**;

- $\boldsymbol{Crop\ Yield\ =\ f\ (Climate)}.$

- Growing Degree Days (GDD) =
$$\frac{\boldsymbol{Max.Temp + Min.Temp}}{\boldsymbol{2}} - \boldsymbol{Base\ Temp};$$

- $\boldsymbol{Crop\ Growth = f(GDD)}.$

- $\boldsymbol{Types\ of\ Crops\ =\ f(Climate)}.$
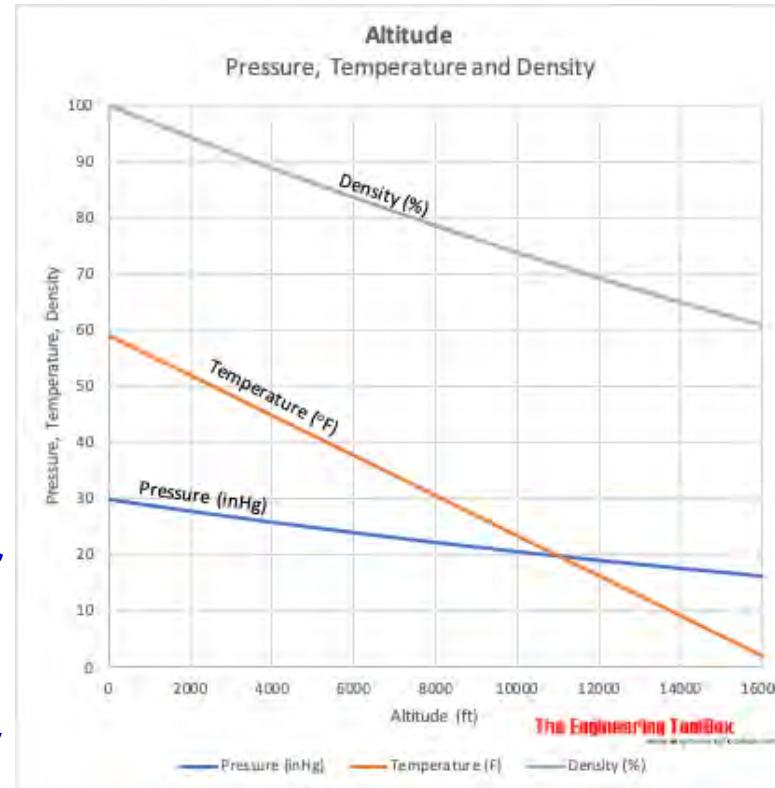

Growing Degree Days (GDD) aka Growing Degree Units (GDUs)
→ a measure of heat accumulation
→ used by farmers to predict plant and animal development rates: date that a flower will bloom, a crop will reach maturity, or an insect will emerge from dormancy
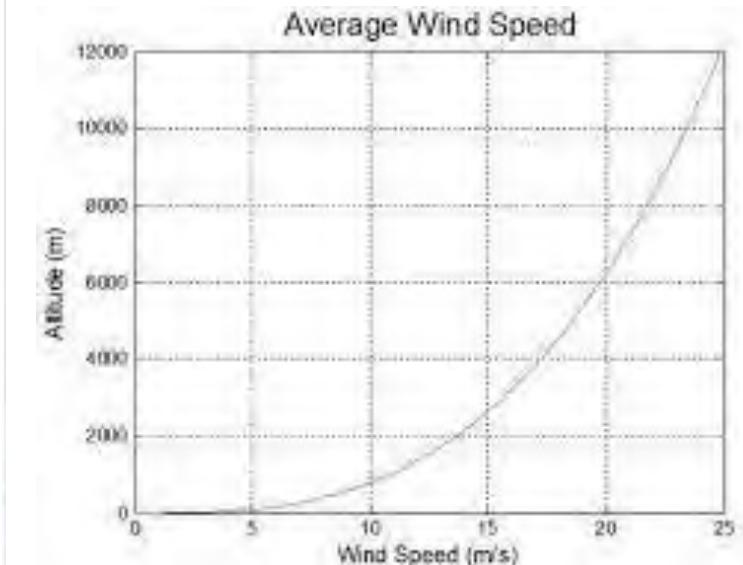

Smart Electronic Systems Laboratory (SESL)

Any Crop, Any Place: Elevation and Slope

- Affects soil formation, water drainage, and availability.

- Limits Arable land.

- 1% of crops are grown with elevation greater than 2000m (e.g., wheat, rye, oats, barley and some vegetables.)

https://www.engineeringtoolbox.com/air-altitude-temperature-d_461.html

https://www.quora.com/Does-wind-speed-increase-at-higher-altitudes-Considering-that-the-air-gets-thinner-it-would-be-assumed-that-the-wind-speed-would-reduce-as-well

Any Crop, Any Place: Soil
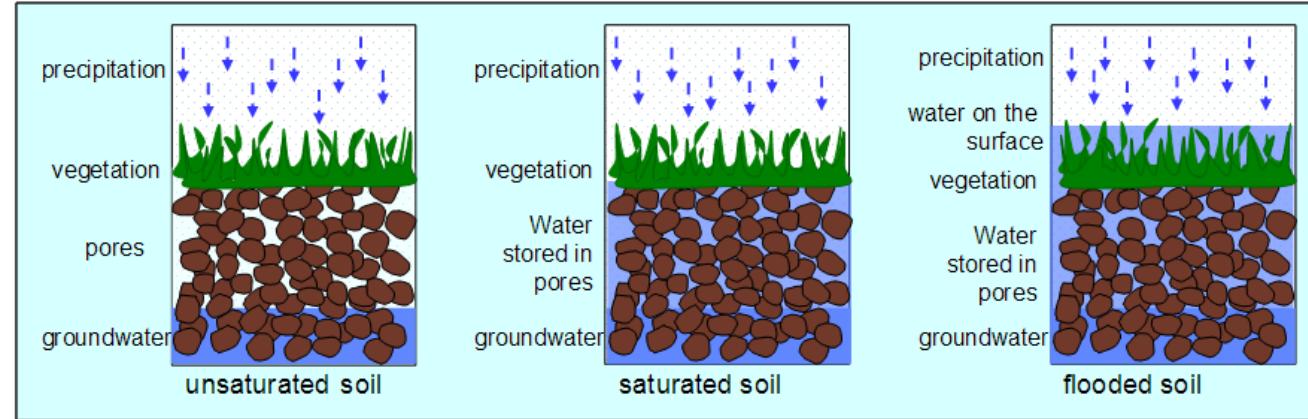

❑ Formed from weathering rocks (source for minerals needed); Organic-matter contents (source of fertilizers).

■ Soil properties effecting the crop:

  ❑ Depth - Approx. 100cm of depth for growth

  ❑ Texture – Determines water holding capacity and root aeration

  ❑ Organic matter content – Breakdowns faster in sandy soils than fine soils

  ❑ Fertility – Potential capacity of soil to support plant growth

  ❑ Minerology – Soil chemical characters like pH, Salinity, Cation-Exchange Capacity (CEC).

Soil provides nutrients to the crops.

Smart Electronic Systems Laboratory (SESL)

Any Crop, Any Place: Soil Water

- $Soil\ Water =$
  $f(Precipitation, Percolation)$

- **Percolation**: Process of a liquid slowly passing through a filter.

- **Precipitation**: Water that is falling out of the sky, e.g., rain, drizzle, snow, sleet, and hail.

- $Types\ of\ Crops, Plant\ Growth = f(Soil\ Water)$.

- Excessive soil water is also a problem during flowering, pollination and grain filling.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Any Crop, Any Place: Vicious Negative Feedback Cycle

- Land usage for other needs

  - Growth is population is causing the need for residential land which is reducing the amount of arable land available for farming.

  - Growth in population → Need for residential land

  - Growth in population → Demand for farm products

  - Demand for farm products → Need for farmland (Paradoxical)

Vicious Negative Feedback Cycle:
Population Increase → Increase in Need for Residential Land → Decrease in Farm Land → Increased Demand for Farm Products

Smart Agriculture - Prof./Dr. Saraju Mohanty

Agricultural Land Reduction is a Global Crisis
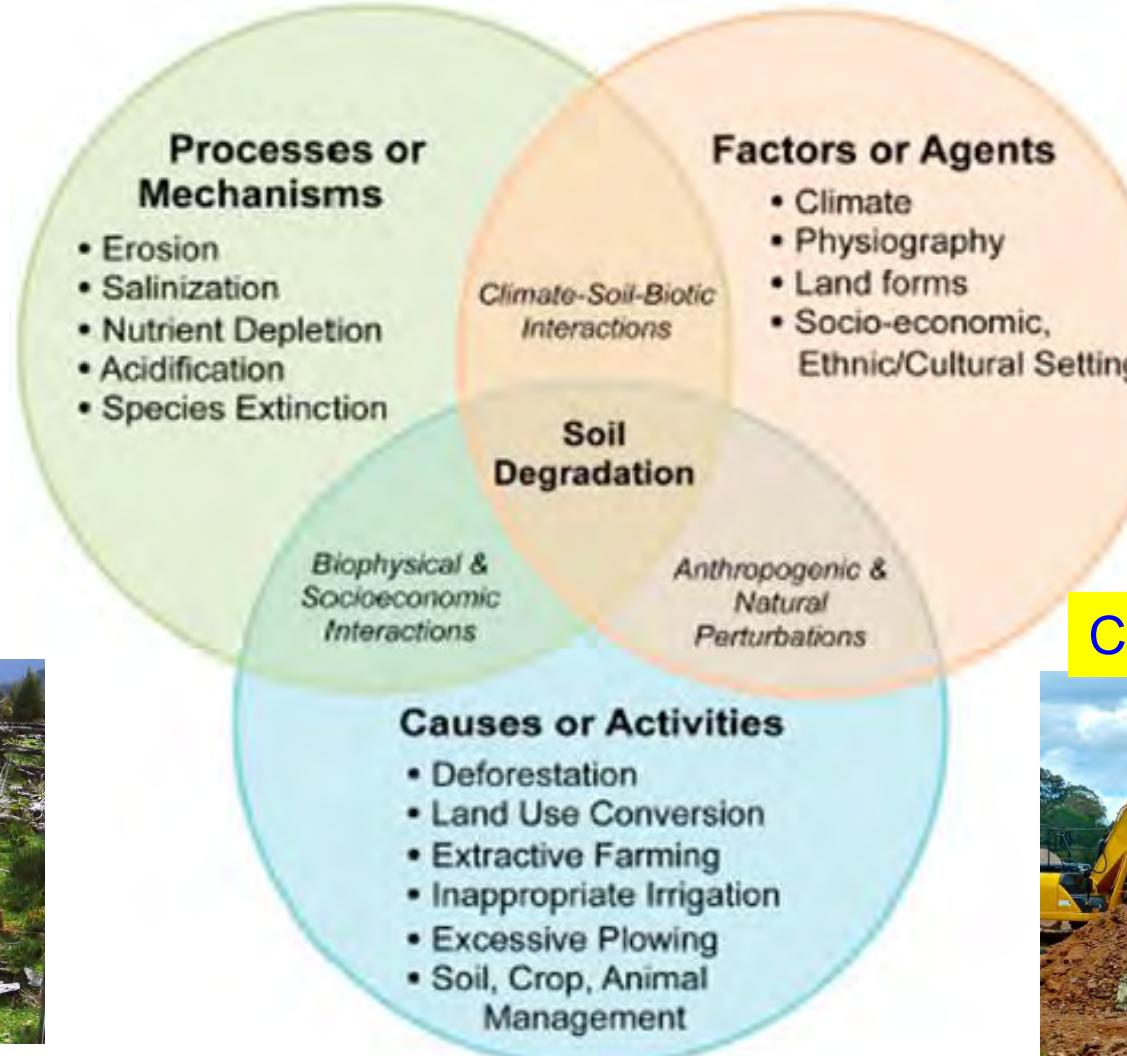

Salination

Soil Erosion

Deforestation
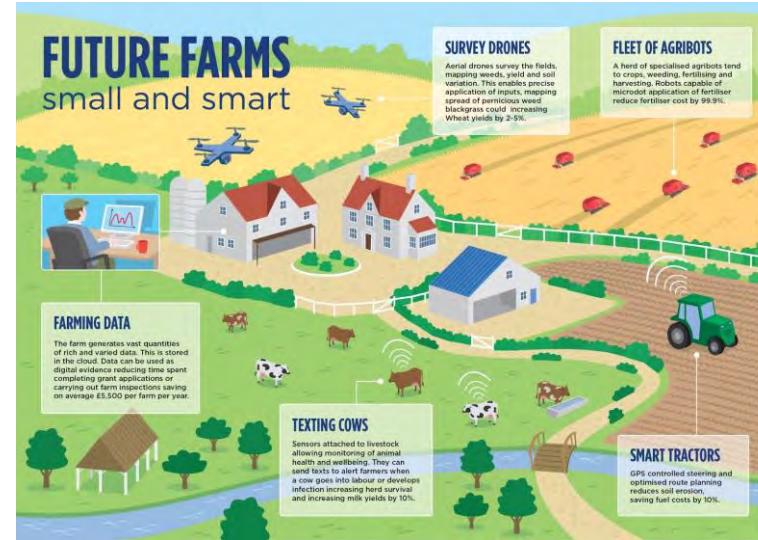

Construction on Farm Land

Processes or Mechanisms
- Erosion
- Salinization
- Nutrient Depletion
- Acidification
- Species Extinction

Factors or Agents

Smart Agriculture - Prof./Dr. Saraju Mohanty

Solution → Smart Agriculture

- Population control techniques are in place and still have not effectively solving the food scarcity.

- Need to make farms climate and environment resistant.

- Finding ways to cultivate and produce reasonable yield in non-favorable conditions.

- Reduce need of resources such as farm area.

Agriculture or farming is the practice of cultivating plants and livestock.
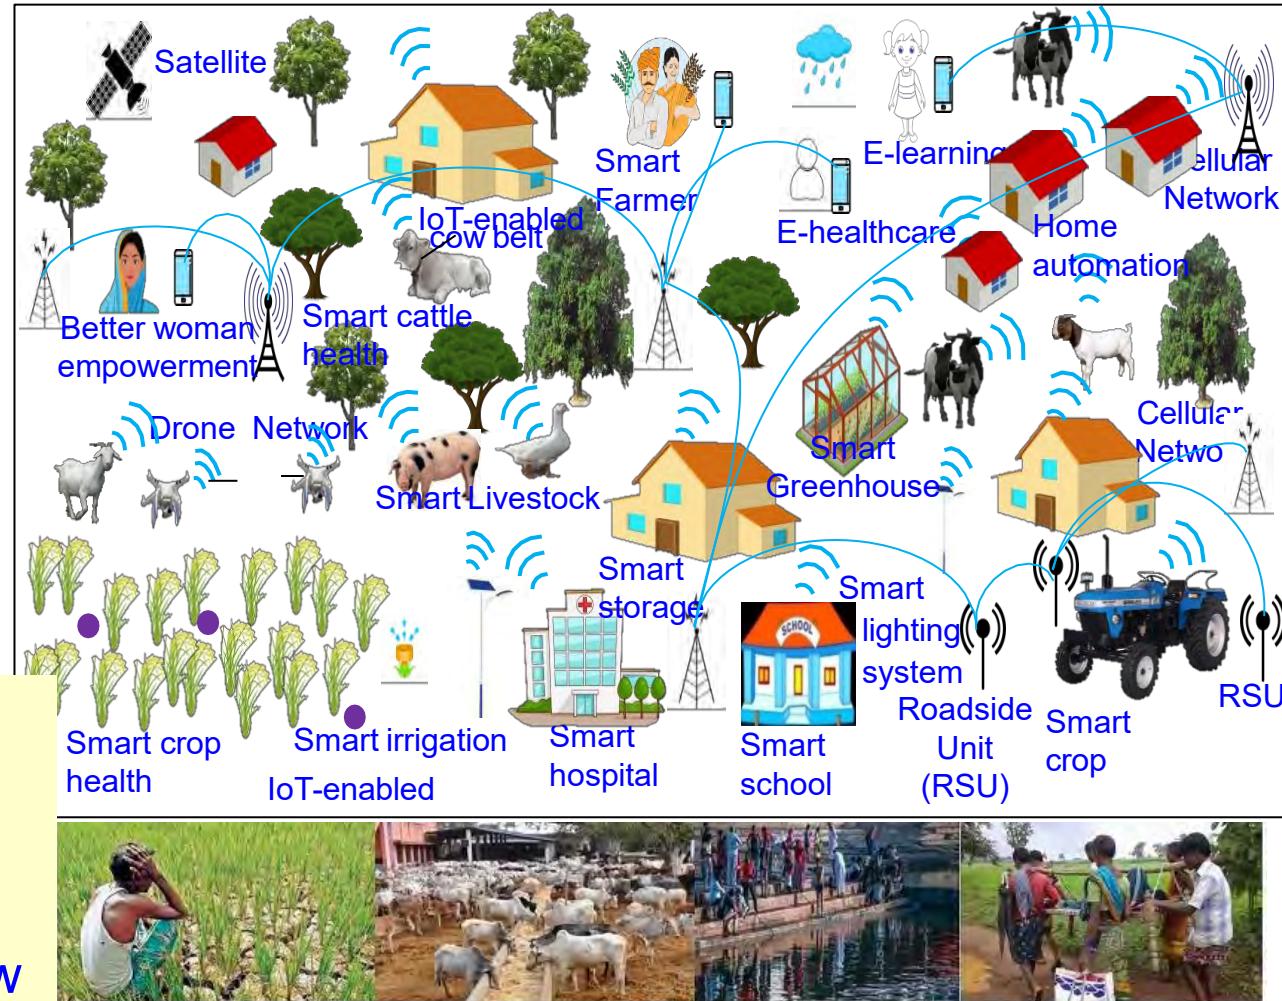

Crucial for → Smart Cities and Smart Villages

Source: http://edwingarcia.info/2014/04/26/principal/
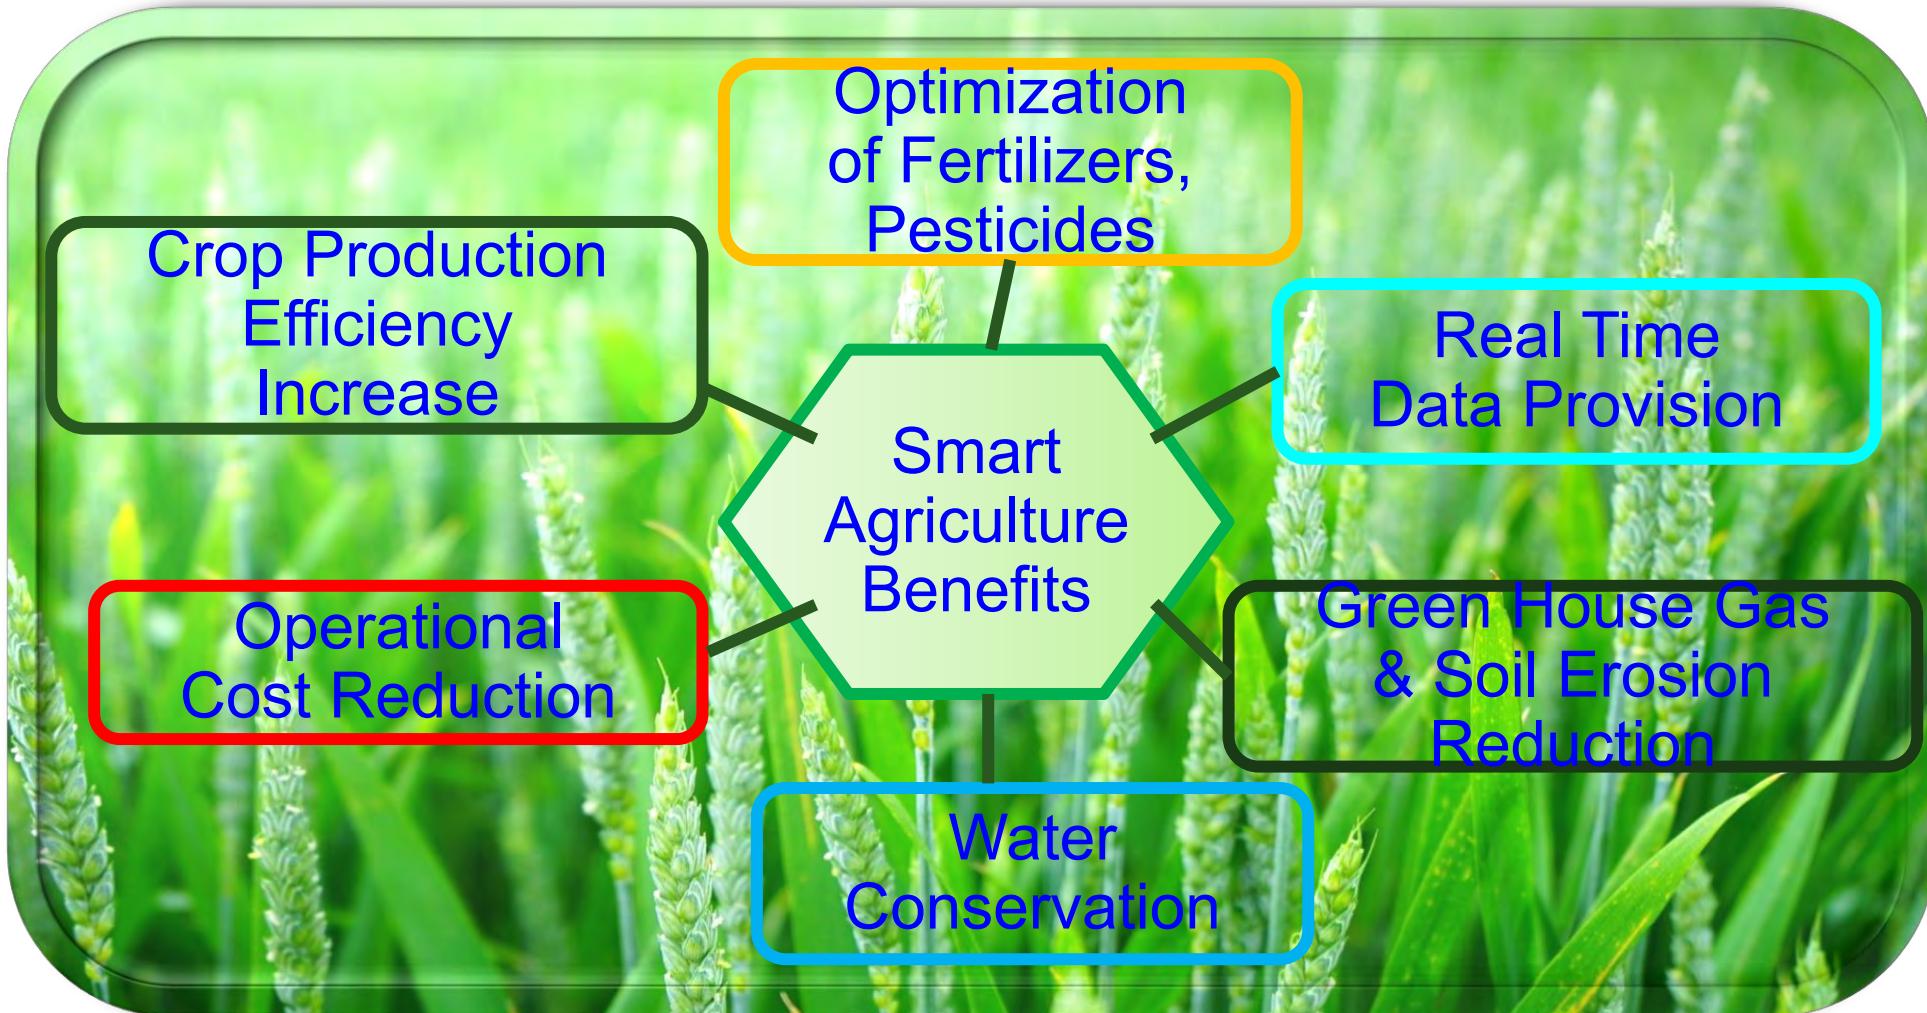

Smart Cities

CPS Types - More
Design Cost - High
Operation Cost – High
Energy Requirement - High

Smart Villages

CPS Types - Less
Design Cost - Low
Operation Cost – Low
Energy Requirement - Low

Agriculture → Smart Agriculture: Broad Overview

Smart Agriculture - Prof./Dr. Saraju Mohanty

Cities and Villages - History

Partial Reconstruction of Chatal Huyuk huts

Source: https://www1.biologie.uni-hamburg.de/b-online/library/darwin/prerm5.htm
Based on a reconstruction by Orrin C. Shane III

"First true cities arose in Mesopotamia, and in the Indus and Nile valleys sometime around 3500 BCE."
-- LeGates and Stout 2016, The City Reader

Indus Valley Civilization (3300 BCE to 1300 BCE)

✓ After 10,000 BC humans settled down in villages.
✓ Neolithic village at Chatal Huyuk in Anatolia (now Turkey) of area 13 hectors built in 7,000 BC.
✓ Partial reconstruction of the village gives an idea of buildings.

Agriculture History

Agriculture or farming is the practice of cultivating plants and livestock.
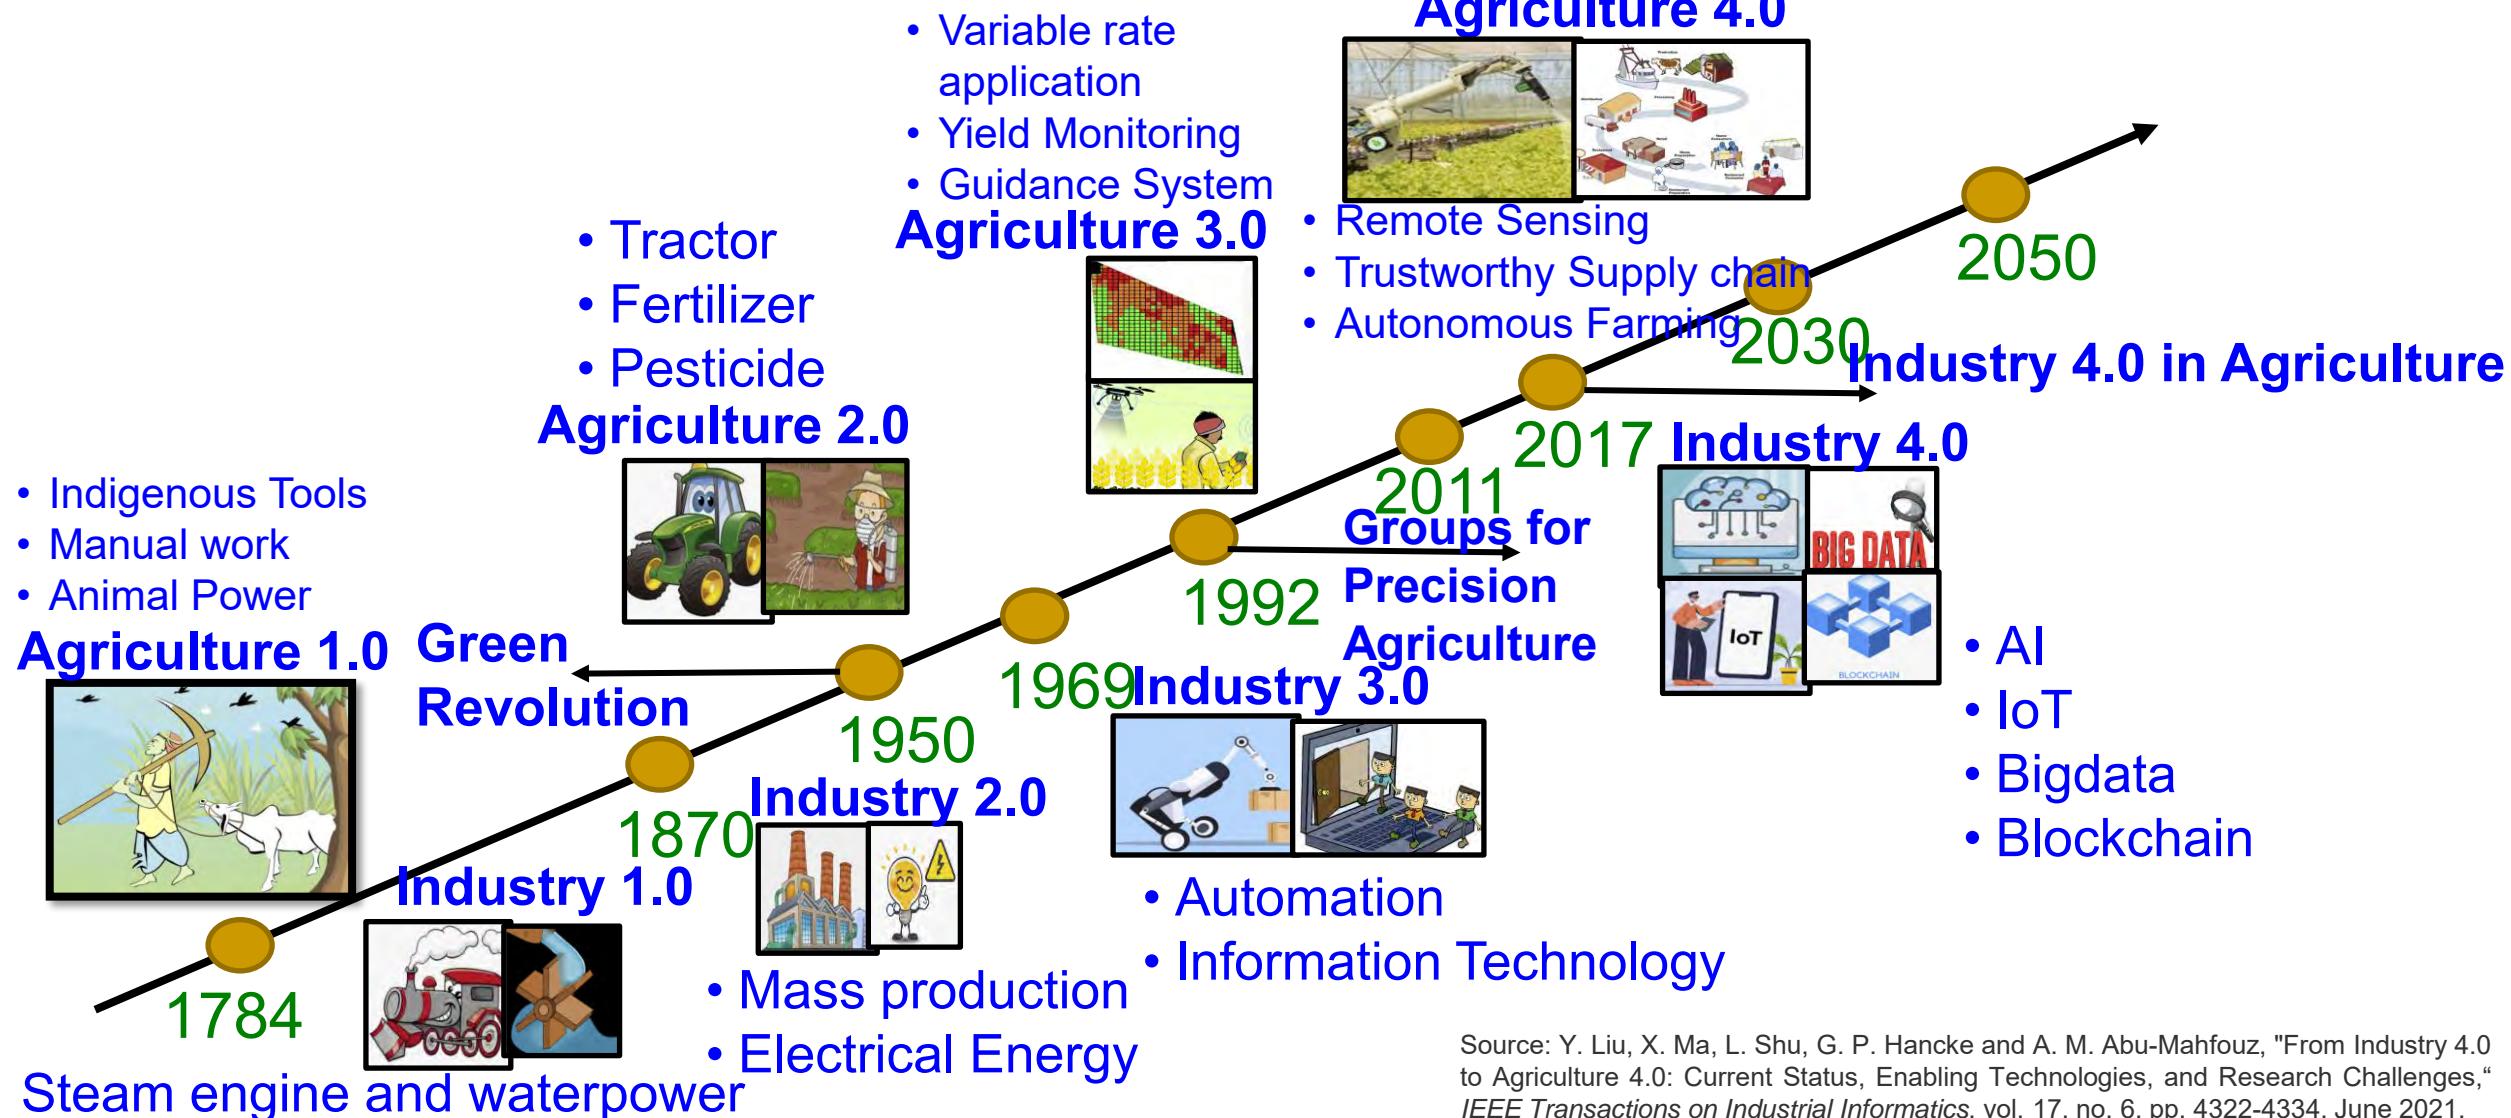

Agriculture played a Key Role in the growth of civilization.

Ancient Egypt
- 15th century BC (1500 BC to 1401 BC)

Smart Agriculture - Prof./Dr. Saraju Mohanty

Agriculture is the Key Factor of Civilization

- **10,000 BC:** Farming started by Ancient Egyptian Civilization on the Nile River.

- **9,000 BC:** Indus Valley civilization started wheat and barley.

- **8,000 BC:** Sumerians started to live in villages near the Tigris and Euphrates rivers and made a canal system for irrigation.

- **8,000 BC:** Asian rice was domesticated on the Pearl River in southern China.

- **3,000 BC:** Americas farmed squash, beans, and cacao.

- **2,500 BC:** Animal-drawn plough in the Indus Valley Civilization.

EST. 1890

Autonomous and Robotic Labor

- Due to migration of people from rural areas to urban areas, there is shortage in labor for farming.

- Use of Autonomous and Robotic labor can increase the productivity and quality of work.

Drones or UAV for Smart Agriculture

- An automated flying tool which has pre-planned flight and controlled by remote is called a drone.
- Usage includes:
  - Imaging for identification of weeds.
  - Fertilizer and weedicide applications.
  - Weather forecasting.
- Makes use of different sensors, actuators and GPS.

Planting from Air

- It is useful when there is large sowing areas.

- Helps in farmlands which are steep, and sowing is very difficult.

- Helicopters are mainly used in this process; a seeder is hanged from the helicopter and sowing is controlled by the controllers inside.

Image source: https://www.recorder.com/Helicopter-low-flying-seed-drop-3800811

Planting and Sowing Tools

- Unlike other autonomous applications implemented in the farms, using autonomous robots for planting and sowing is successful.

- It is easy to implement and perform the operations.

- Before planting, seedbed must be prepared for creating favorable conditions.

Automatic Irrigation Systems

- Surface Drip Irrigation (SDI) is used to distribute the water evenly in the farm.

- These SDI are typically controlled manually to increase the efficiency.

- Using moisture sensors to integrate to the SDI can help in better crop yield.

- IoT sensors are integrated with SDI which can also be linked with fertigation (Irrigation water plus fertilizer).
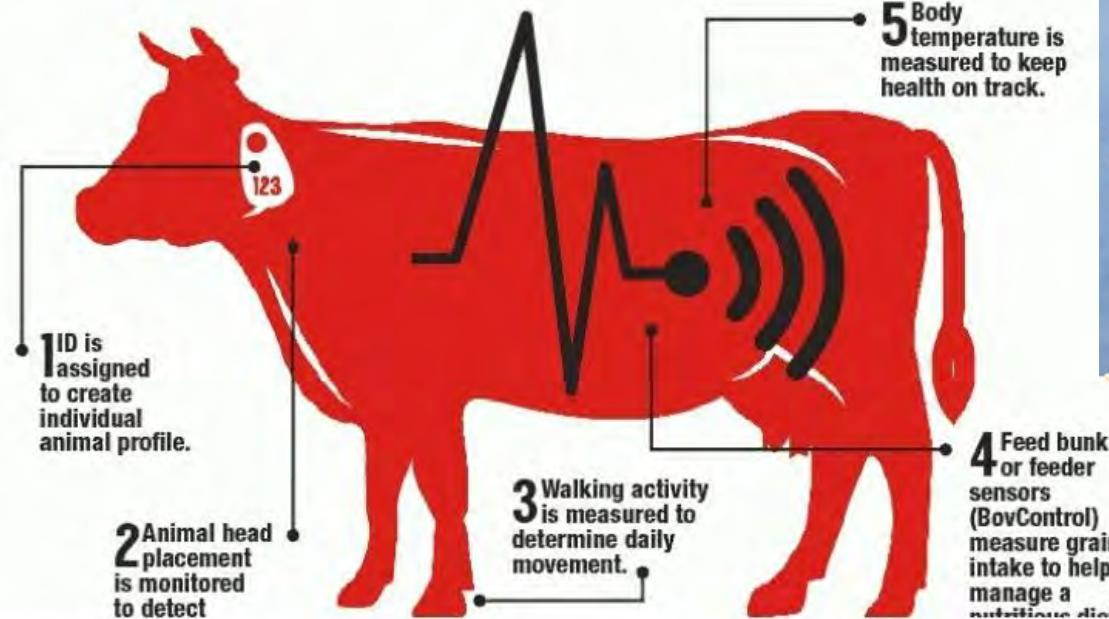

Livestock Monitoring System

Agriculture Data – Crowd Sensing

- Data is an asset.

- Helps in communicating farm related issues with stakeholders.

- Smart phones and wearable devices are used to collect data from the farms.

- Advantages include low cost, scalable and mobility.

- Components of crowd sensing: Data processing technology, Incentive Mechanism, Crowd sensing software platform

Agriculture Data – Acquisition Interface

- Data Acquisition is an interface that is used to collect the data from the external environment and send it to the internal systems. Data acquisition technologies mainly includes:
  - Serial ports for connecting multiple instruments for automatic data acquisition.
  - USB interface.
  - Wireless communication modules.
  - Sensors and Actuators.
  - Satellite systems.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Agriculture Data – Storage

- **Data Storage Technology**

  - Direct Attached Storage (DAS): A storage device is attached directly to the host system to record data.

  - Network Attached Storage (NAS): A device is connected to the network which serves the purpose of storage.

  - Storage Area Network (SAN): A network of storage devices are connected to network of servers.
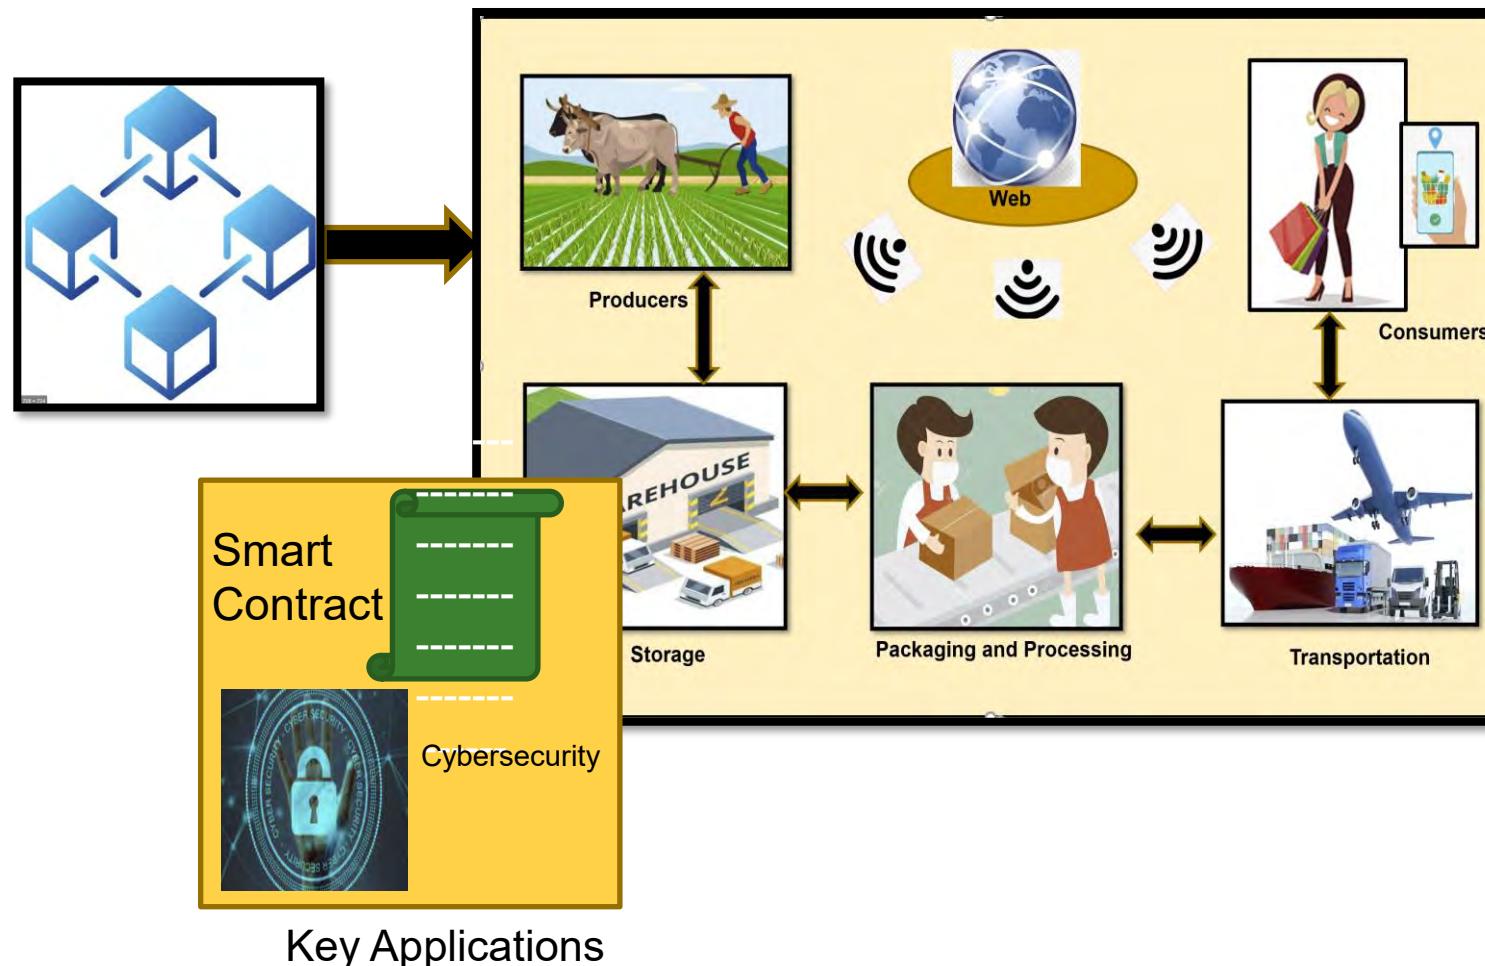

- **Databases are the software application used for performing data storage operations:**

  - Relational database : follows relational model

  - Non-relational databases

Smart Agriculture - Prof./Dr. Saraju Mohanty

Agriculture Data – Processing Technologies

- Millions of IoT devices → generates large amounts of data

- Need for efficient Big data analytics methods

- Artificial Intelligence plays a major role in extracting information from such large data.

- Conventional AI methods are resource intensive

- Tiny ML is a promising application in IoT based systems.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Learning Curve for Smart Agriculture can be Long

- Smart Agriculture requires setting up of IoT architecture and sensor networks.

- Errors in such setup can lead to drastic losses in the farms.

- Farmers should be thoroughly acquainted with usage of this technology.

Connectivity can be an Issue in Rural Areas

- Reliable internet connectivity is not possible in many of the remote villages in the world.

- Network performance and bandwidth requirements may not be achieved because lack of the infrastructure as in urban areas.

- Delay in real-time applications if computing is dependent on IoT-cloud.
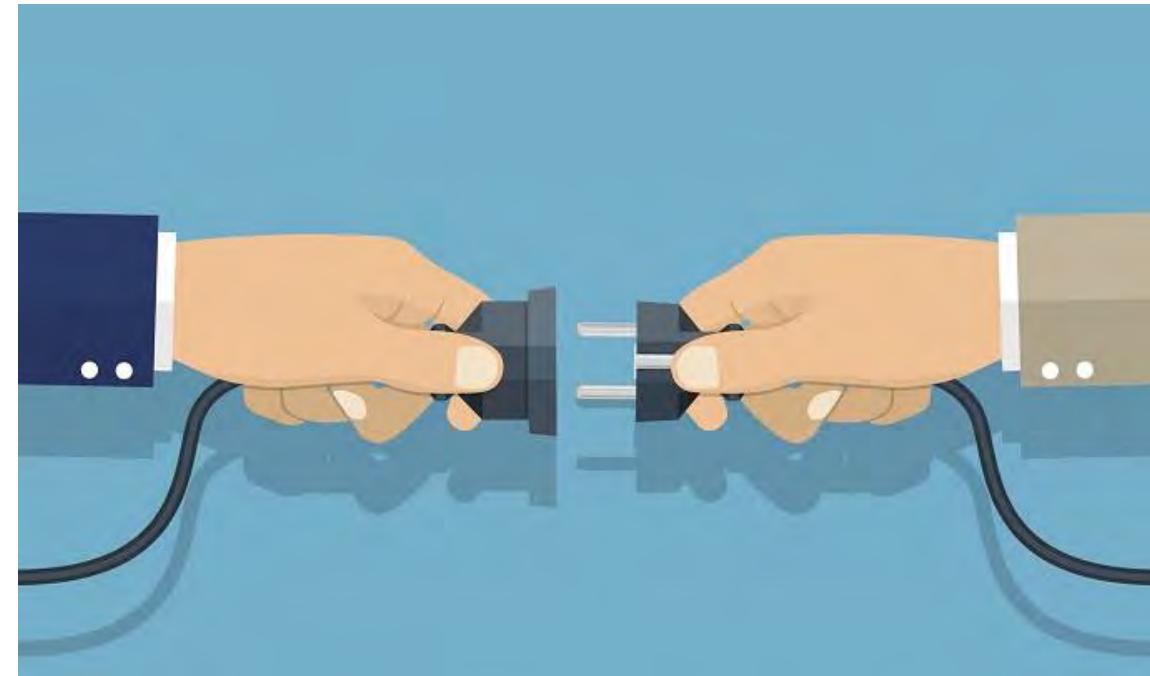

Energy Depletion Risks

- Smart agriculture may reduce need for resources but needs lot of data centers.

- All the infrastructure used will consume large amounts of energy which may cause energy depletion.
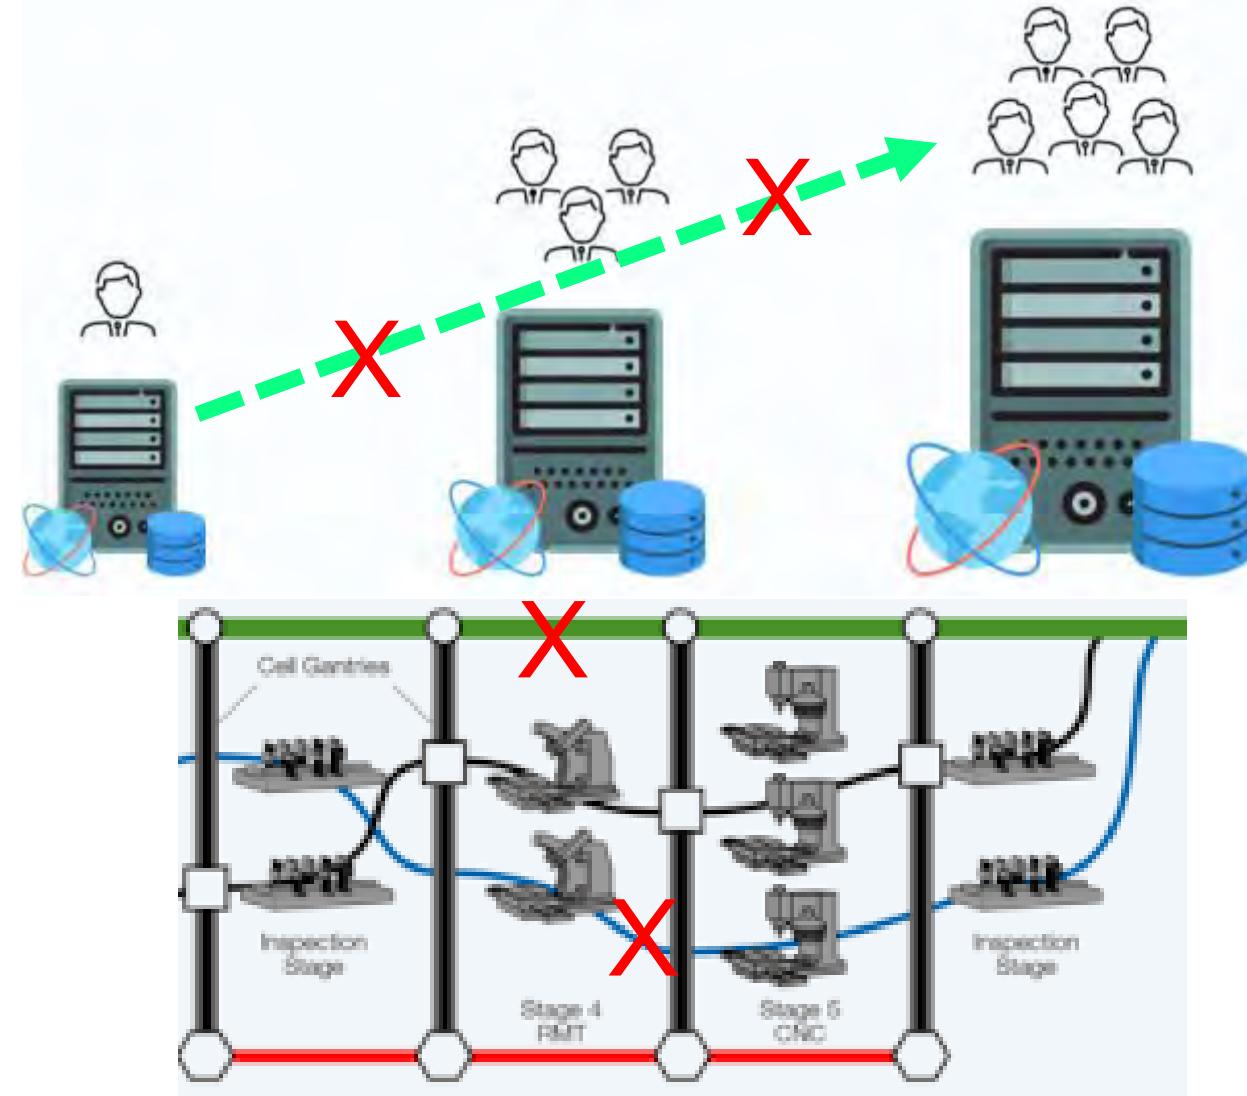

Interoperability Can be an Issue for the Smart Agriculture Equipment

- Technologies used in Smart Agriculture are developing rapidly.

- Lack of technology standards → Interoperability issues.

- Creation of additional gateways to translate data between two systems is more common.

- Solution lies in making the standalone devices and gateways to farmer-friendly platforms.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Smart Electronic Systems Laboratory (SESL)

Lack of Scalability and Configurability

- Farms can be any size, single owner can have large farms or several small farms.

- Same technology should be capable enough to handle different variety of farmlands in dimension and nature.

- Technologies used should be self-configurable.

Smart Agriculture - Prof./Dr. Saraju Mohanty
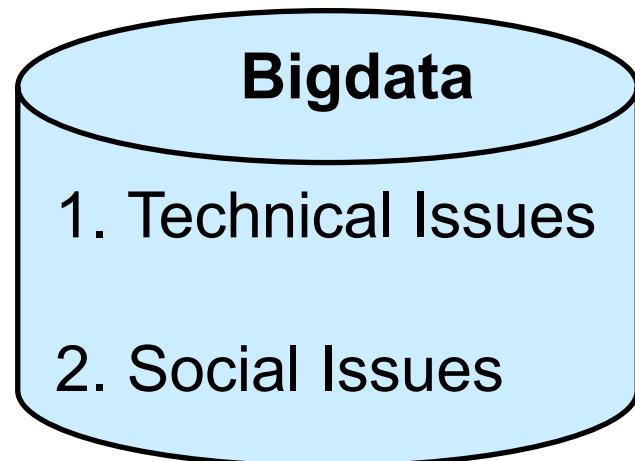

Technical Failures

- Even most resilient systems will have failure due to unforeseen events.

- Such events in Smart Agriculture can incur large losses both in terms of money and quality of products.

- Food safety can be compromised because of such issues.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Bigdata in Smart Agriculture

- Millions of IoT devices work in smart agriculture and generate large amounts of data.

- Inferring and extracting information from such large data is impossible and needs efficient data analytics tools.

Bigdata

1. Technical Issues

2. Social Issues

Security Issues in IoAT

❑ Smart Farms are Hackable Farms: IoT in Agriculture can improve the efficiency in productivity and feed 8.5 billion people by 2030. But it can also become vulnerable to various cyber security threats.

https://spectrum.ieee.org/cybersecurity-report-how-smart-farming-can-be-hacked

https://cacm.acm.org/news/251235-cybersecurity-report-smart-farms-are-hackable-farms/fulltext

❑ DHS report highlights that implementation of advanced precision farming technology in livestock monitoring and crop management sectors is also bringing new cybersecurity issues along with efficiency

Smart Agriculture - Prof./Dr. Saraju Mohanty

Crop Damage and Disease Problem

- Disease prevents the growth of plants.

    - Affect quality of the crop.

    - Reduce final yield.
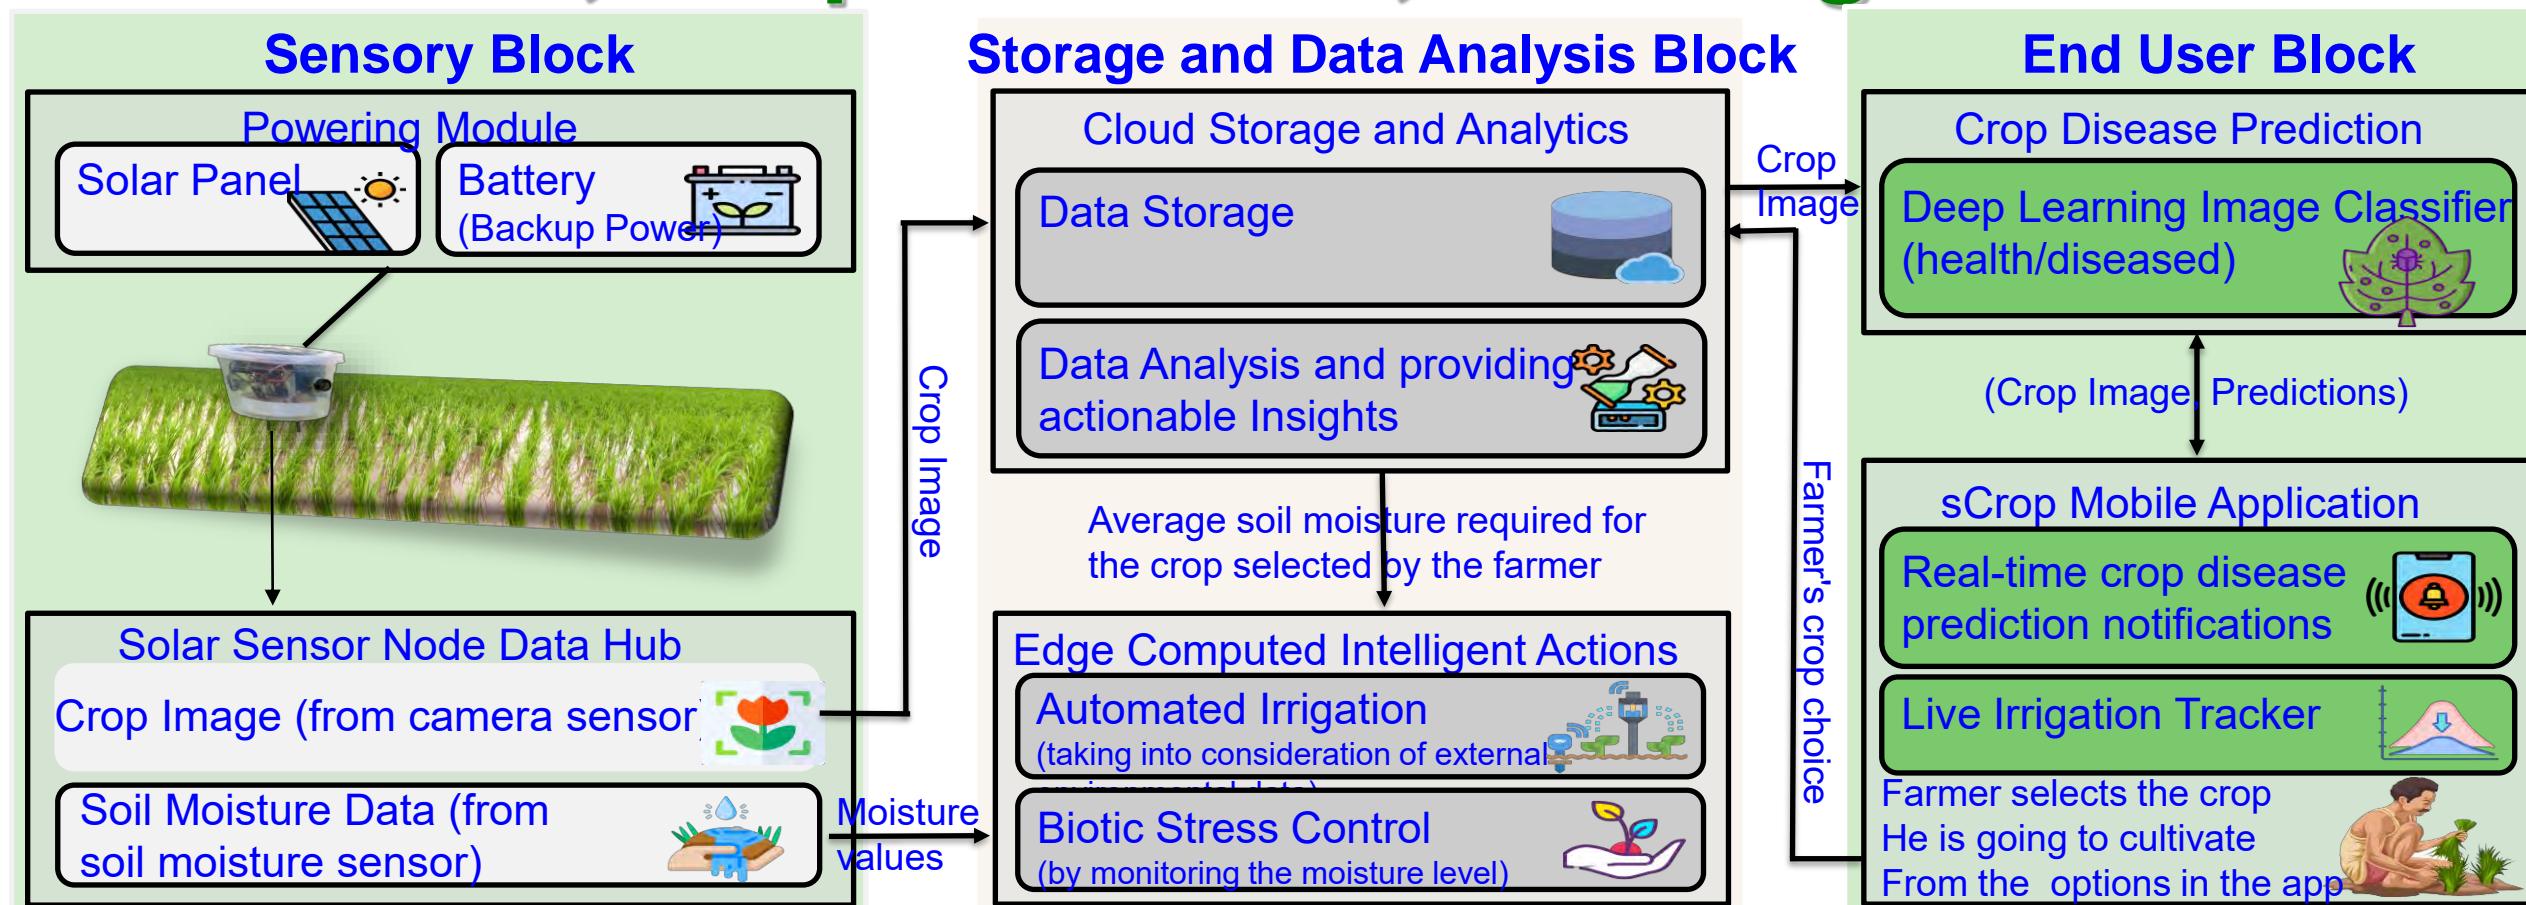

- Farmers need to –

    - Monitor the field regularly.

    - Detect disease early.

    - Identify the disease.

    - Know about the severity of the disease (many of them).

    - Determine the extent of damage (from disasters).

UNT DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING College of Engineering EST. 1890
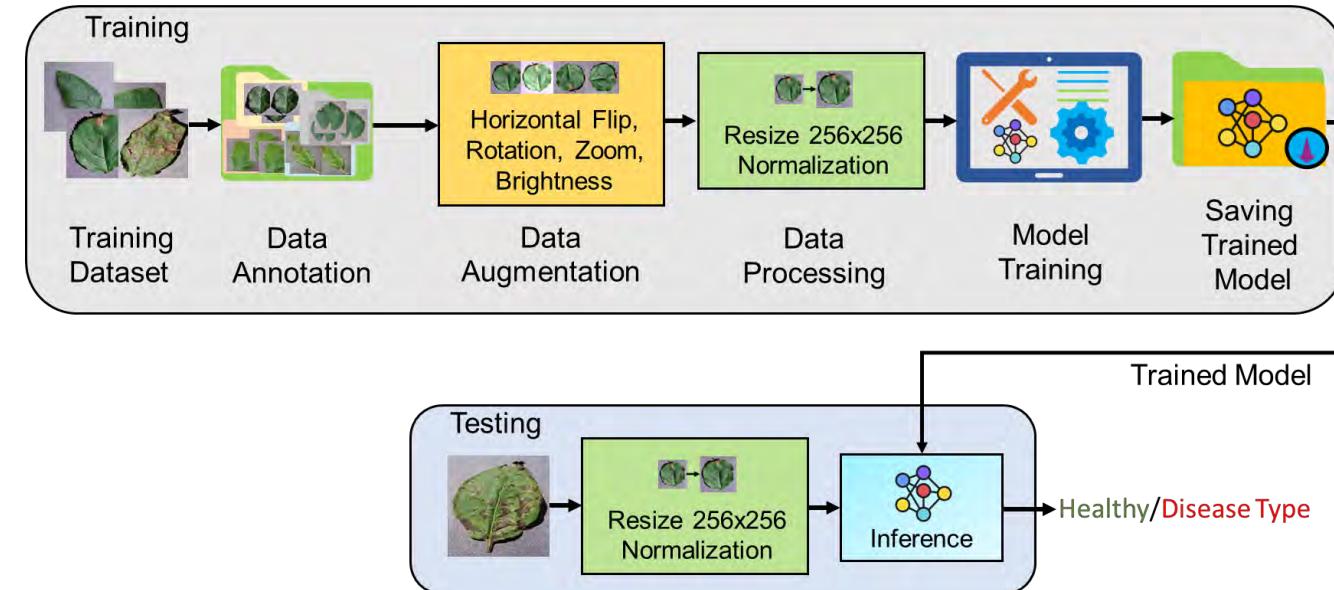

Our aGROdet: A Framework for Plant Disease Detection and Leaf Damage Estimation

- Detect plant diseases.

- Estimate corresponding leaf damage.

- Identification of the disease -
  - Convolutional neural network-based method.

- Estimation of the severity of leaf damage –
  - Pixel-based thresholding method.

- Regular monitoring of fields and checking conditions of the plants through **aGROdet** can detect the disease early.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Smart Electronic Systems Laboratory (SESL)

Our aGROdet 2.0: An Automated Real Time Approach for Multiclass Plant Disease Detection

- Manual observation is still the most common method of detecting plant diseases.

  - Labor intensive.

  - Ineffective.

  - Requires expert services.

    - Expensive.

- Wrong identification causes wrong use of pesticides.

  - Causes secondary damage.

- Automatic and accurate monitoring of plant disease and damage estimation are necessary along with disease identification.

Source: A. Mitra, **S. P. Mohanty**, and E. Kougianos, "A Smart Agriculture Framework to Automatically Track the Spread of Plant Diseases using Mask Region-based Convolutional Neural Network", in *Proceedings of the IFIP International Internet of Things Conference (IFIP-IoT)*, 2022, pp. 68--85, DOI: https://doi.org/10.1007/978-3-031-18872-5_5.

Our aGROdet 2.0: An Automated Real Time Approach for Multiclass Plant Disease Detection

Start

Photo Taken by UAV/Phone Camera

Image Resize (256 x 256)

Plant Disease Detection using Mask R-CNN

Apple Black Rot

Disease Localization using Mask R-CNN

Apple Black Rot
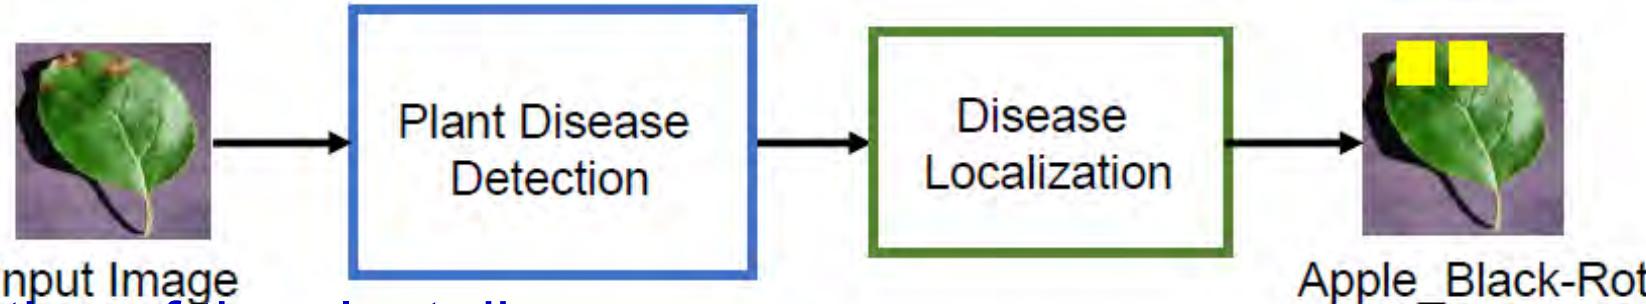

- Photo of the leaves are taken.

- They are resized to 256x256 to be detected using the trained model.

- A Mask Region-based Convolutional Neural Network (R-CNN) is used to detect the disease along with the disease localization.

- Here, the problem is considered as an object detection problem.

- Object detection is a task in computer vision that involves identifying the presence of one or more items in each image as well as their location and the category of object that they belong to.

Smart Electronic Systems Laboratory (SESL)
UNT EST. 1890 DEPARTMENT OF COMPUTER SCIENCE & ENGINEERING College of Engineering

Our aGROdet 2.0: An Automated Real Time Approach for Multiclass Plant Disease Detection
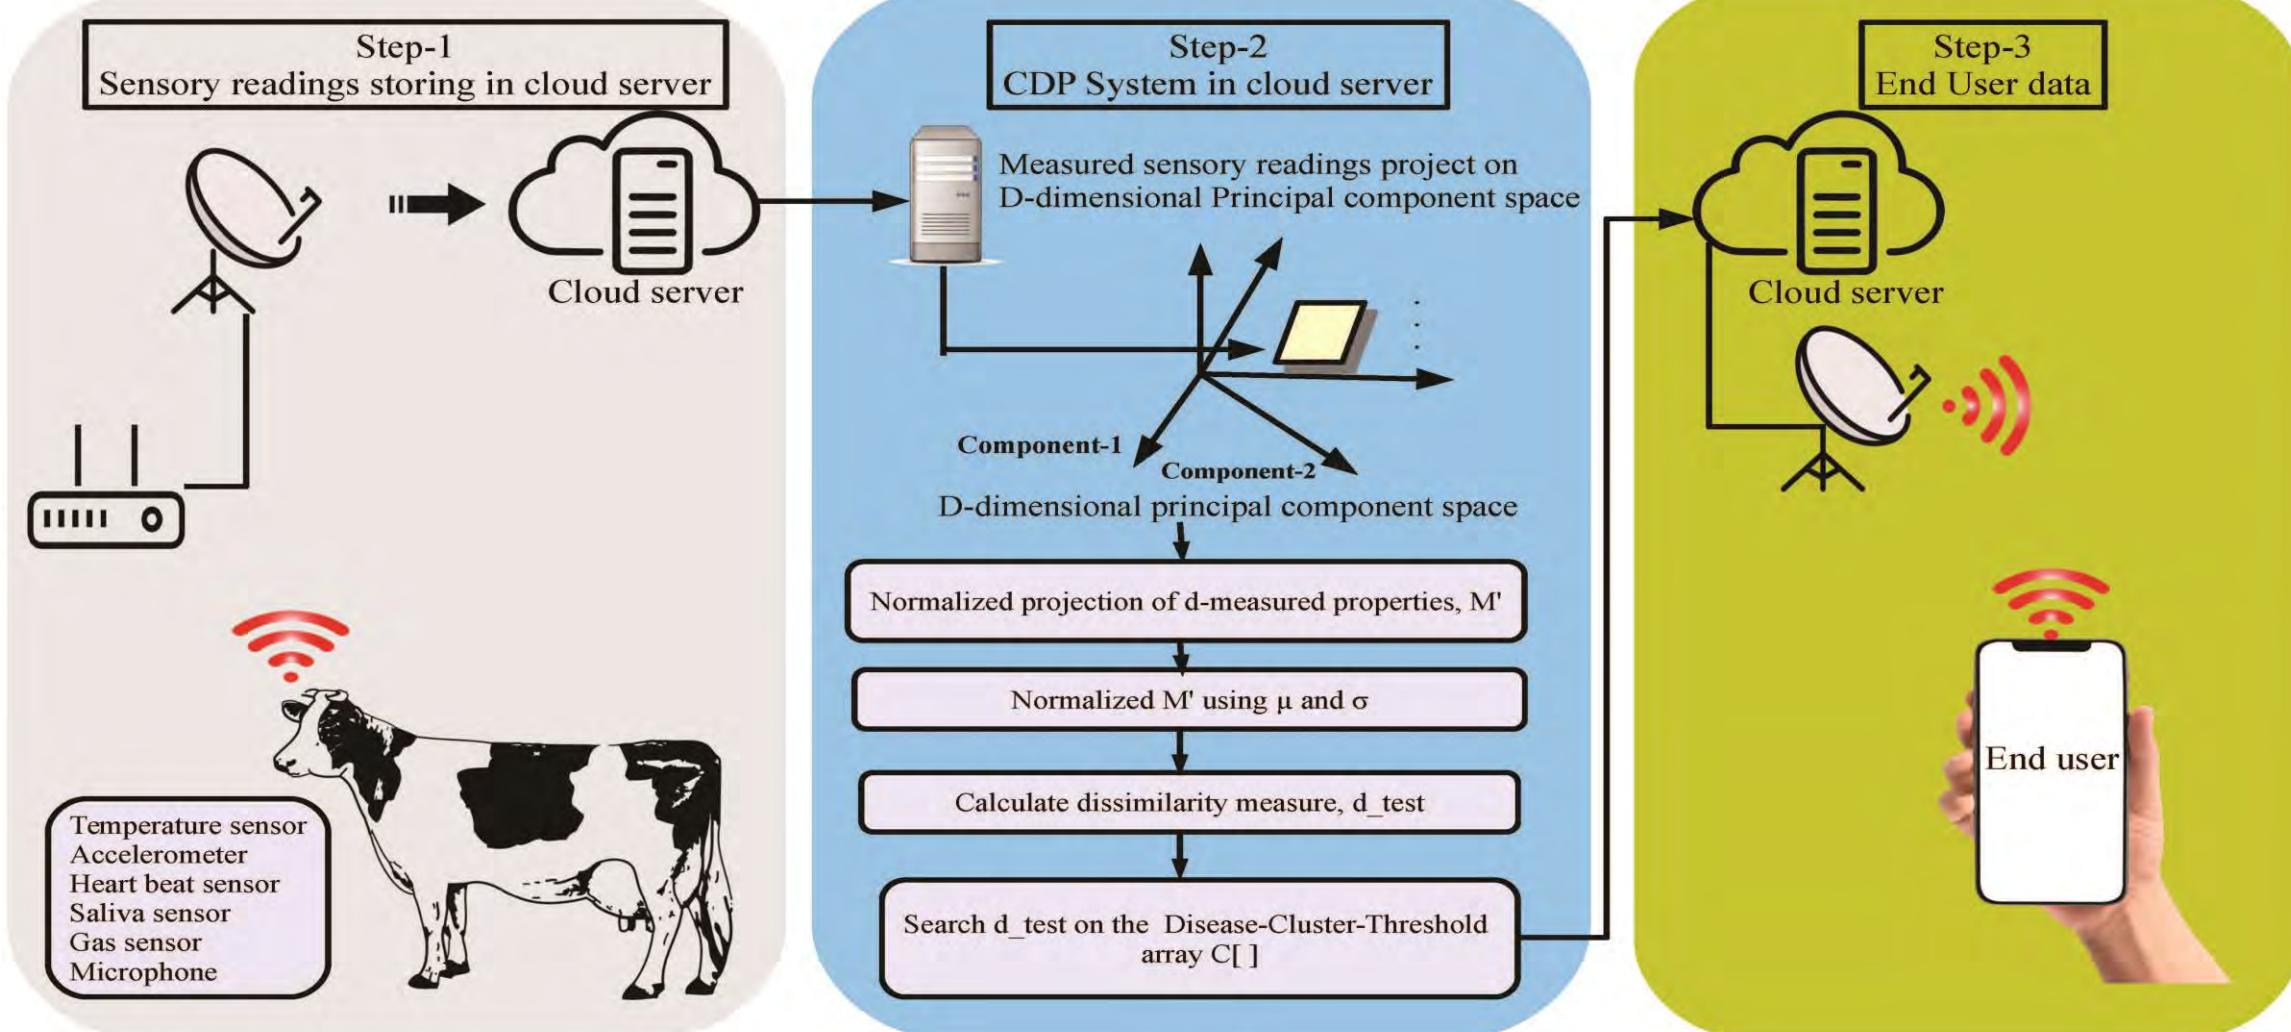

Input Image → Plant Disease Detection → Disease Localization → Apple_Black-Rot

- Early detection of the plant diseases.

- Fully automatic method.

- No expert service is needed for disease detection.

- Very little effort is needed from the users' side. Users only need to take pictures of the damaged leaves.

- This process is the first step of disease severity estimation.

- Estimation of disease severity plays a pivotal role in calculating the optimal quantity of pesticides.

Our sFarm: Solution

- Tangle is a data structure behind the IOTA which is a Directed Acyclic Graph (DAG).

- Directed Acyclic Graphs (DAG) are the data structures which grow in one direction and doesn't have cyclic structures within.

- Tangle is maintained and updated at all the nodes in the network.

- Any new transaction is published will be attached to the Tangle tips.

- Will be single source of truth.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Imbalance Diet is a Global Issue

- Imbalanced diet can be either more or fewer of certain nutrients than the body needs.

- In 2017, 11 million deaths and 255 million disability-adjusted life-years (DALYs) were attributable to dietary risk factors.

- Eating wrong type of food is potential cause of a dietary imbalance:
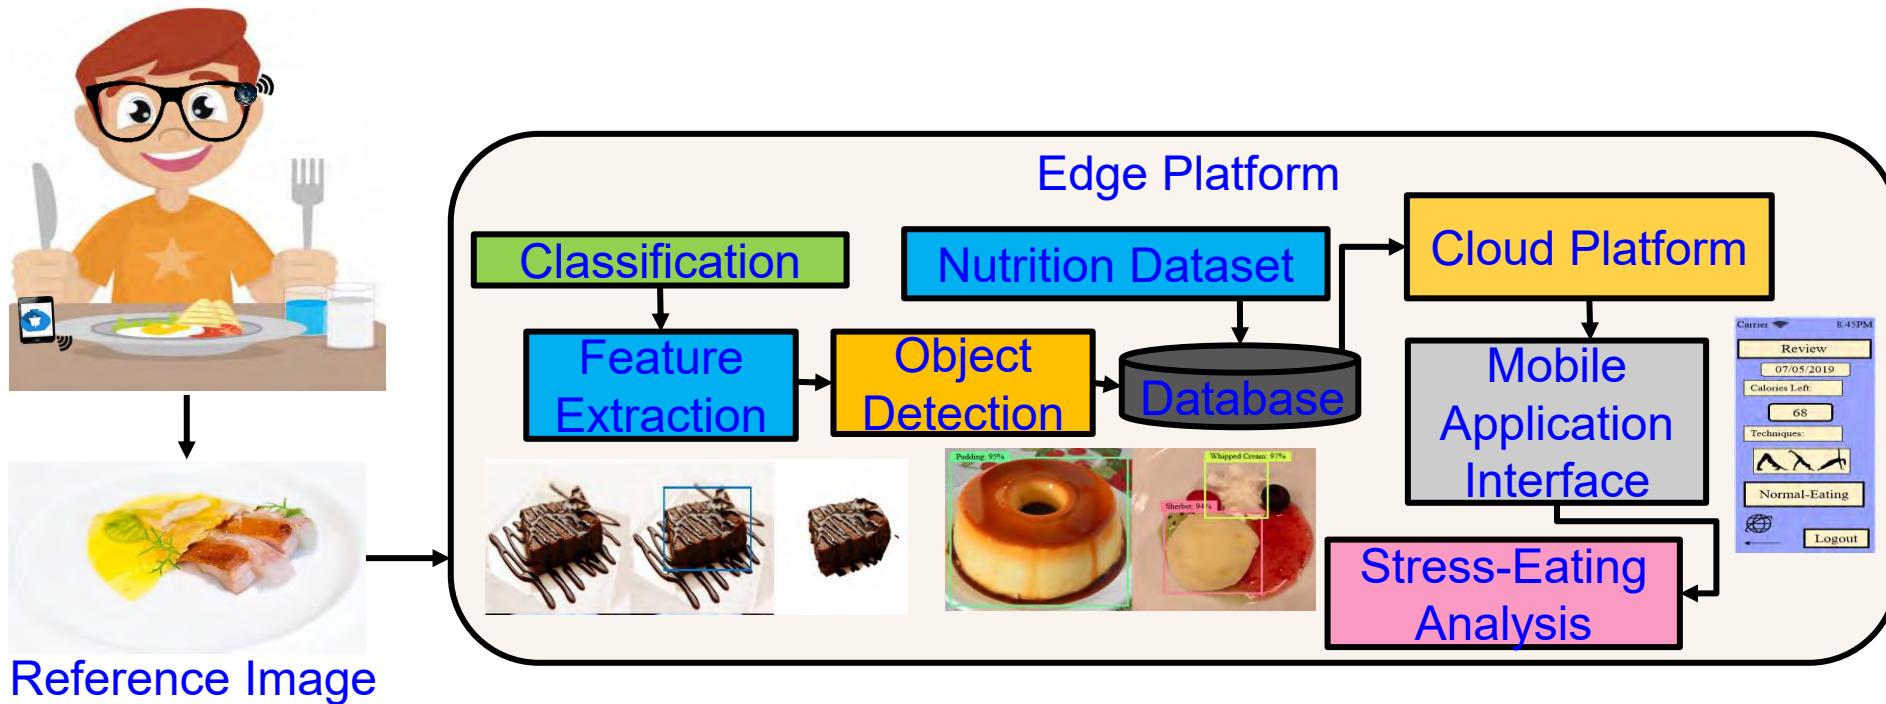

Source: https://obesity-diet.nutritionalconference.com/events-list/imbalanced-diet-effects-and-causes

What is Federated Learning (FL) ?

❑ Federated Learning is way of model training in ML for heterogeneous and distributed data.

❑ It preserves the Privacy of data.

❑ Data does not come to the Model. Here Model is taken to the data.

Source: Z. Li, V. Sharma, and S. P. Mohanty, "Preserving Data Privacy via Federated Learning: Challenges and Solutions", *IEEE Consumer Electronics Magazine*, Vol. 9, No. 3, May 2020, pp. 8--16.
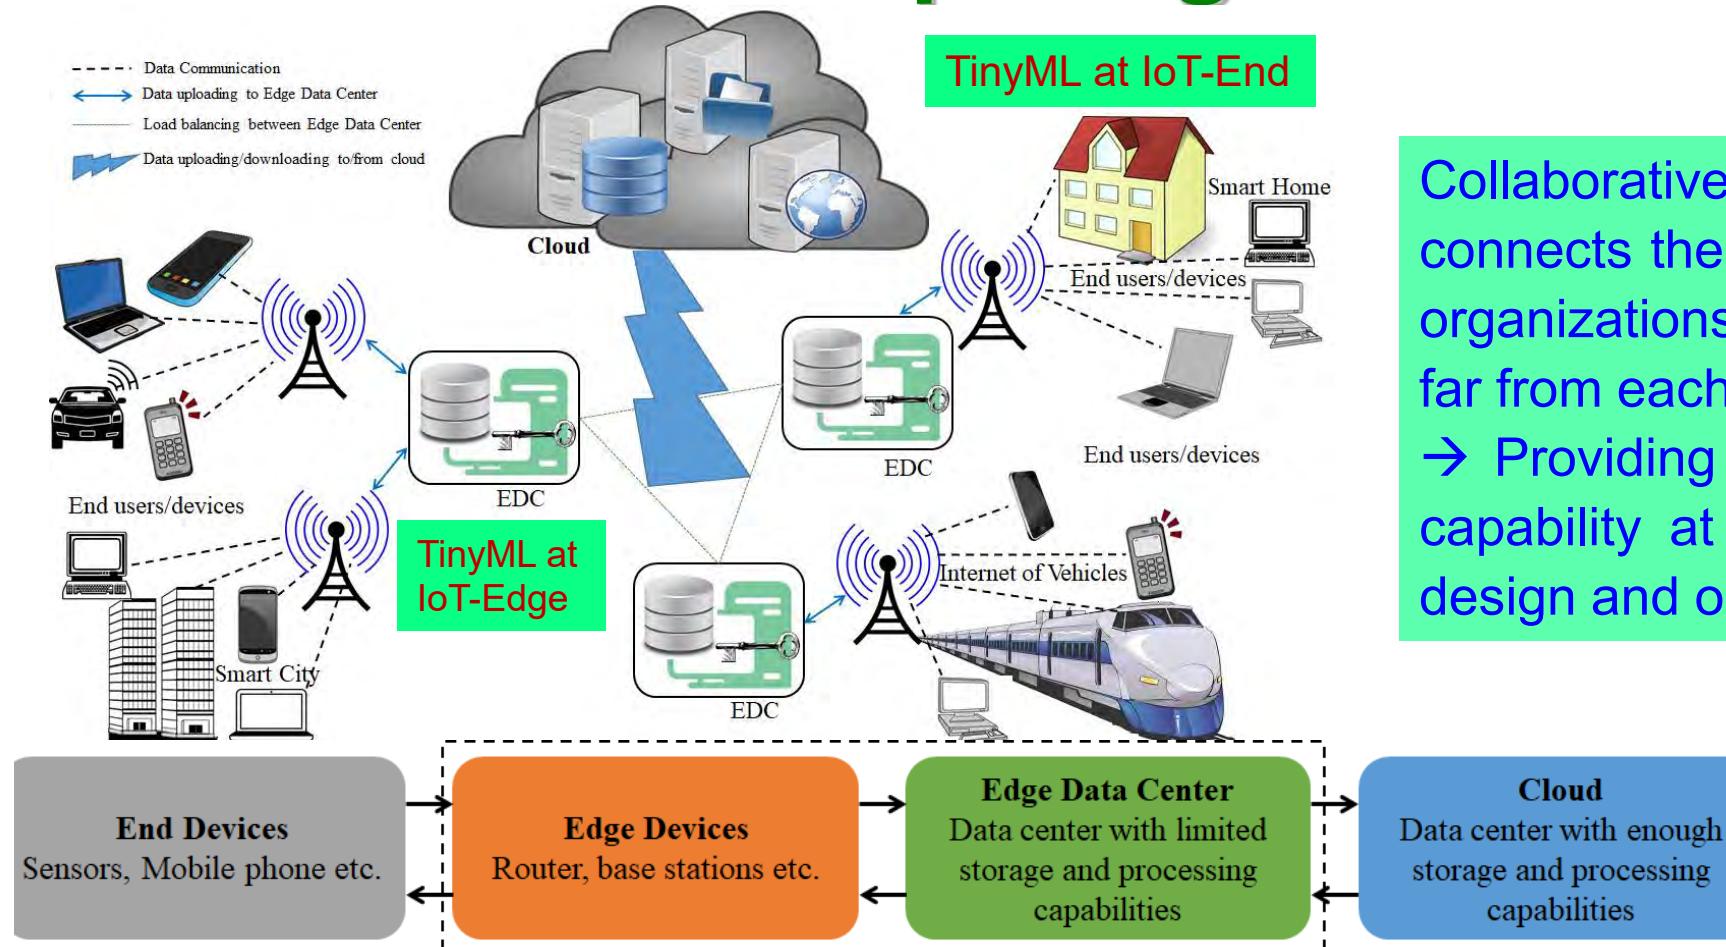

Motivation of Federated Learning (FL)

- Quality data exists at different location on various edge devices.

- Data privacy laws control the movement of data.

- FL is the way to provide ML solution without breaking privacy laws.

Source: Z. Li, V. Sharma, and S. P. Mohanty, "Preserving Data Privacy via Federated Learning: Challenges and Solutions", *IEEE Consumer Electronics Magazine*, Vol. 9, No. 3, May 2020, pp. 8--16.

Collaborative Edge Computing is Cost Effective Sustainable Computing for Smart Villages

TinyML at IoT-End

TinyML at IoT-Edge

Collaborative edge computing connects the IoT-edges of multiple organizations that can be near or far from each other
→ Providing bigger computational capability at the edge with lower design and operation cost.

Our Proposed Secure Edge Datacenter

Secure edge datacenter –
- Balances load among the EDCs
- Authenticates EDCs

Algorithm 1: Load Balancing Technique

1. If (EDC-I is overloaded)
2.   EDC-I broadcast (E_i, L_i)
3. EDC-J (neighbor EDC) verifies:
4. If (E_i is in database) & ($p \leq 0.6$ & $L_i <<(n-m)$)
5.   Response $E_{Kpu_i}(E_j||K_j||p)$
6. EDC-I perform $D_{Kpr_i}(E_j||K_j||p)$
7. $k'_j \leftarrow E_j$
8. If ($k'_j = k_j$)
9.   EDC-I select EDC-J for load   balancing.

Response time of the destination EDC has reduced by 20-30% using the proposed allocation approach.

Conclusions and Future Research
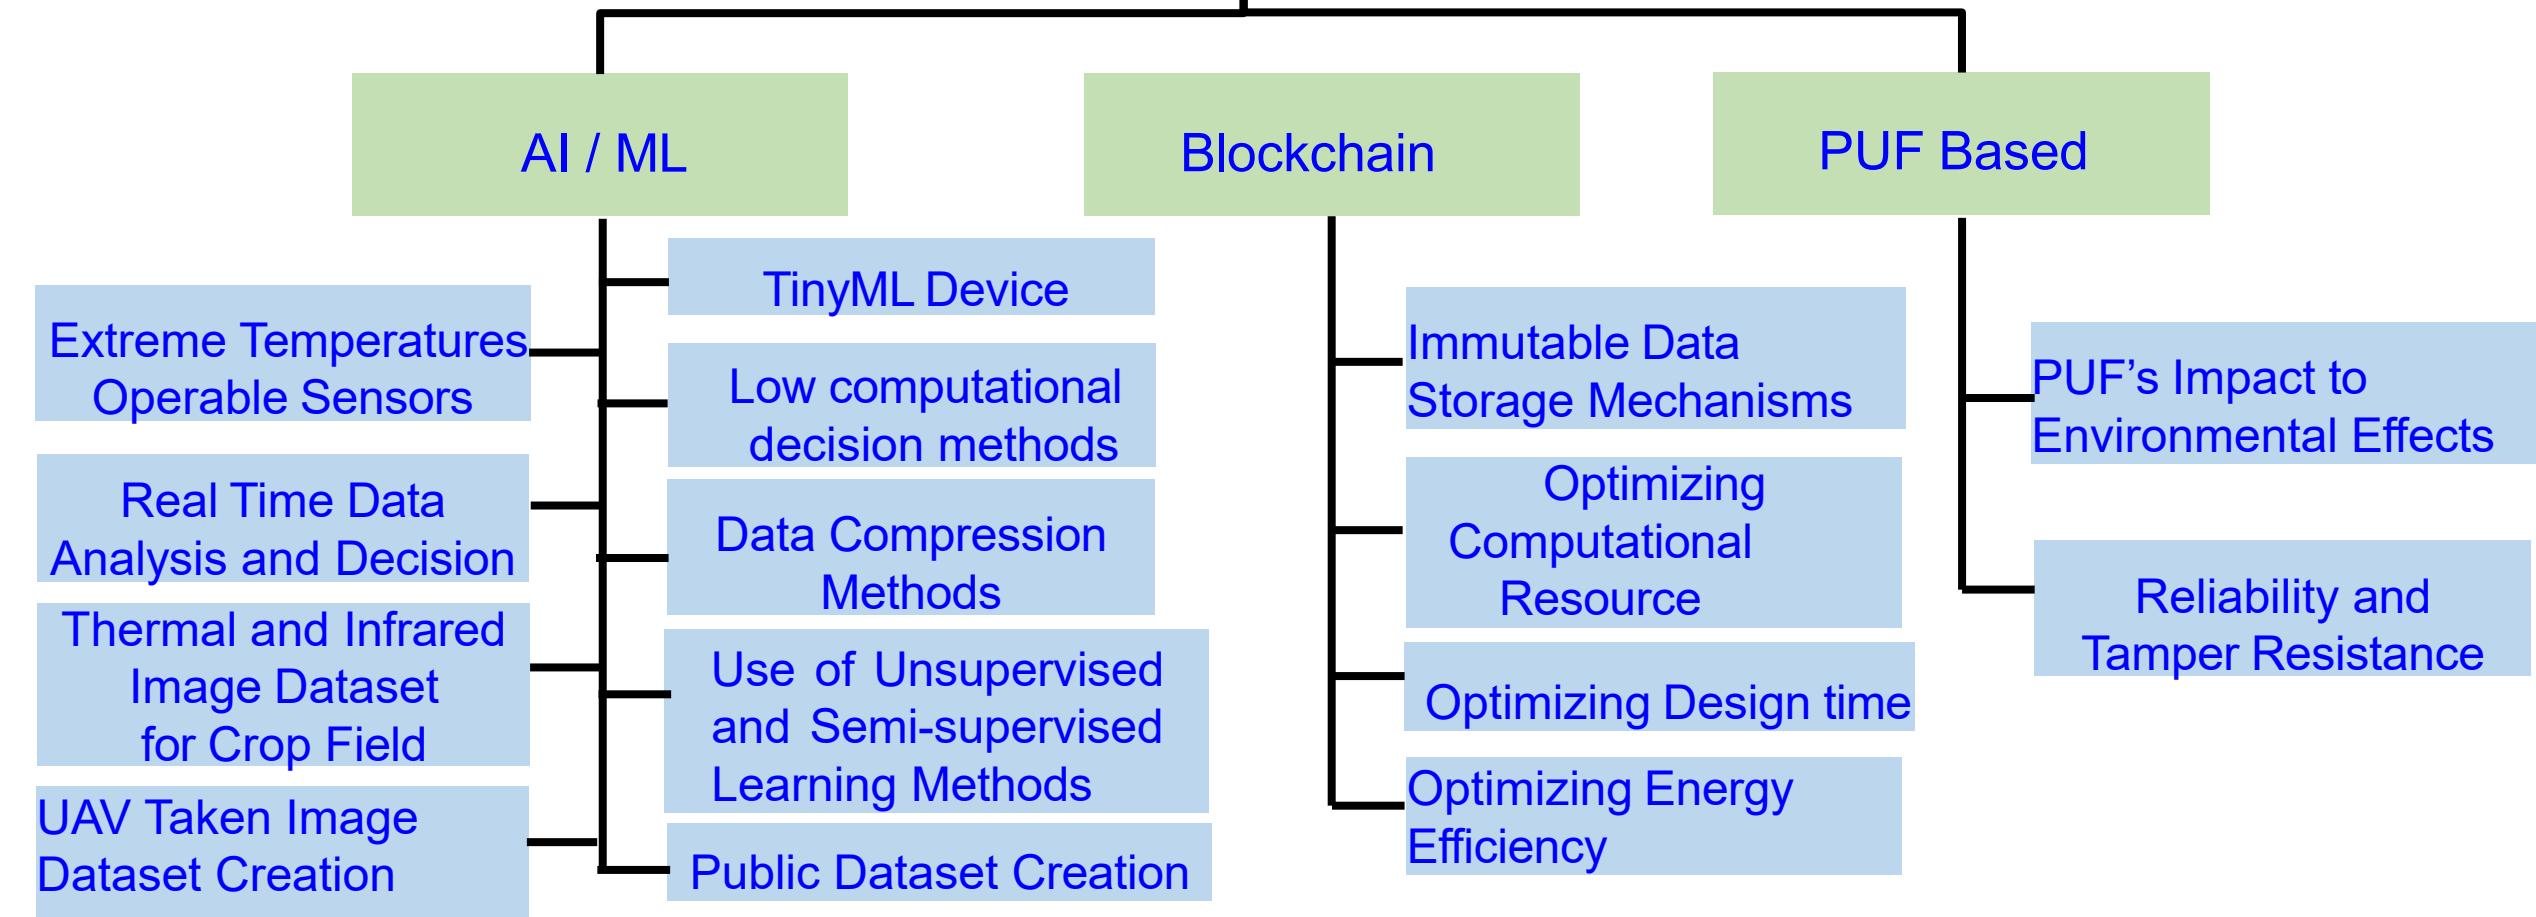

Smart Agriculture - Multifold Research Possibility

| Levels	Field Level	Processing & Distribution Level	Consumer Level
	Food Production	Processing — Distribution	Retail & Food Services — Consumer
Affecting Factors	Drought, Flood, Frost, Disease, Hail, Wildfire, Storm, Humidity, Soil Nutrients, pH of Water	Extreme Temperature, Humidity Variation, Wildfire, Flood, Insect & Pests	Extreme Temperature, Humidity Variation, Wildfire, Flood, Seasonality
Effects	Crop Damage, Crop Loss, Crop Growth Reduction, Crop Yield Reduction, and Finally Financial Loss of the Farmers.	Supply Chain disruption	Shortage of Food, Food Price Increase, Inflation
Research Areas	Crop damage Estimation, Yield Estimation, Insurance Processing Automation, Growth Estimation	Supply Chain Management	Food Safety, Consumer Behavior, Nutrition
Technologies	AI/ML/Deep Learning, Block Chain, PUF, Robotics, IoT, UAV	AI/ML, Block Chain, Advanced Analytics, 3D Printing, IoT, Robotics	AI/ML, Analytics, Data Collection, Statistics, Mathematics, Sociology

Planting, Growth, Harvesting

Smart Agriculture - Prof./Dr. Saraju Mohanty

Smart Electronic Systems Laboratory (SESL)
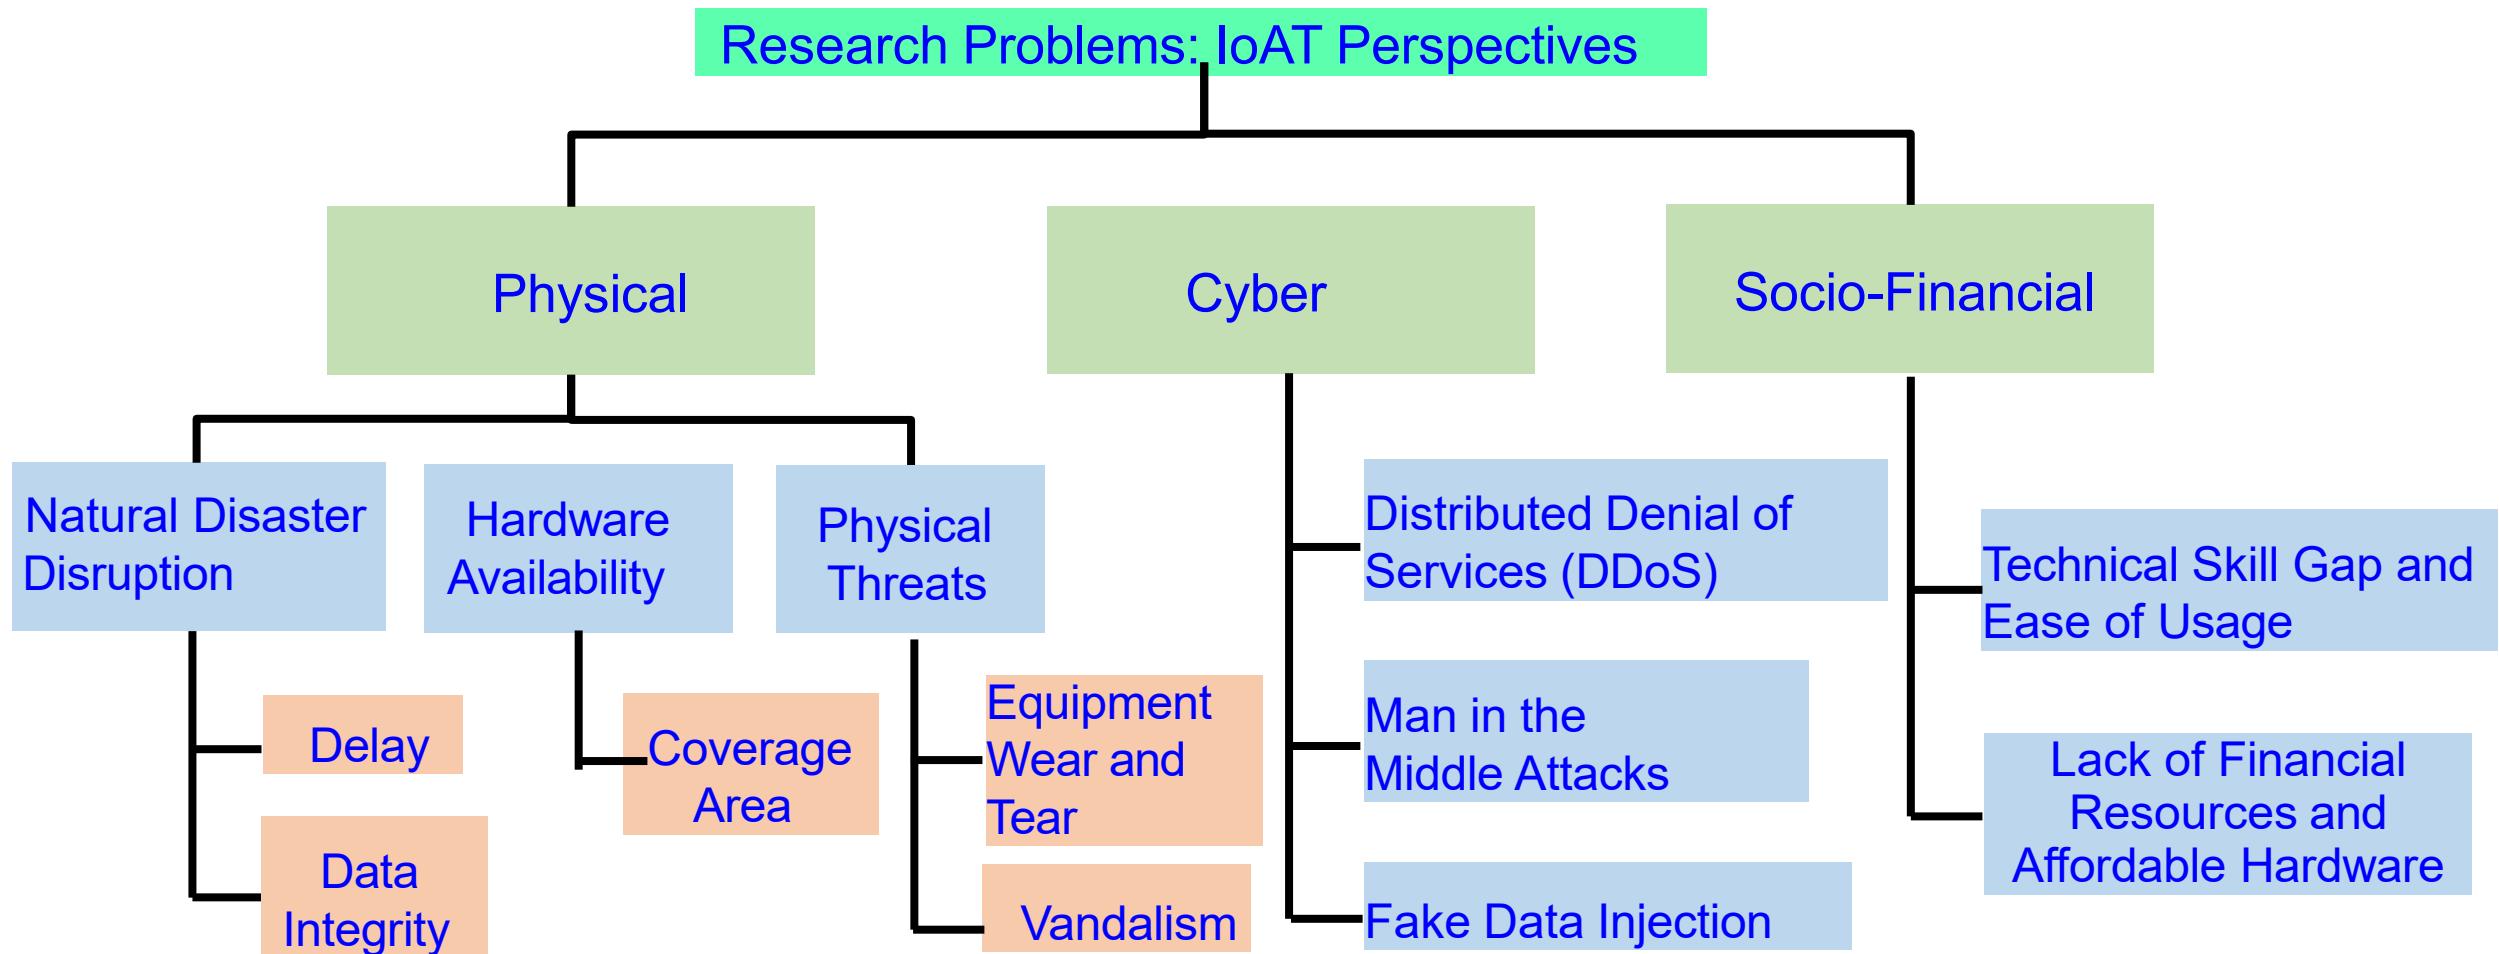

Smart Agriculture - Research Problems

Research Problems: A-CPS Perspective

AI / ML

- Extreme Temperatures Operable Sensors
- Real Time Data Analysis and Decision
- Thermal and Infrared Image Dataset for Crop Field
- UAV Taken Image Dataset Creation

- TinyML Device
- Low computational decision methods
- Data Compression Methods
- Use of Unsupervised and Semi-supervised Learning Methods
- Public Dataset Creation

Blockchain

- Immutable Data Storage Mechanisms
- Optimizing Computational Resource
- Optimizing Design time
- Optimizing Energy Efficiency

PUF Based

- PUF's Impact to Environmental Effects
- Reliability and Tamper Resistance

Source: A. Mitra, S. L. T. Vangipuram, A. K. Bapatla, V. K. V. V. Bathalapalli, **S. P. Mohanty**, E. Kougianos, and C. Ray, "Everything You wanted to Know about Smart Agriculture", *arXiv Computer Science*, arXiv:2201.04754, Jan 2022, 45-pages.

Smart Agriculture - Research Problems

Research Problems: IoAT Perspectives

Physical
- Natural Disaster Disruption
  - Delay
  - Data Integrity
- Hardware Availability
  - Coverage Area
- Physical Threats
  - Equipment Wear and Tear
  - Vandalism

Cyber
- Distributed Denial of Services (DDoS)
- Man in the Middle Attacks
- Fake Data Injection

Socio-Financial
- Technical Skill Gap and Ease of Usage
- Lack of Financial Resources and Affordable Hardware

Source: A. Mitra, S. L. T. Vangipuram, A. K. Bapatla, V. K. V. V. Bathalapalli, **S. P. Mohanty**, E. Kougianos, and C. Ray, "Everything You wanted to Know about Smart Agriculture", *arXiv Computer Science*, arXiv:2201.04754, Jan 2022, 45-pages.

Conclusion

- Smart Agriculture is a very needed advancement for sustainability of humans in coming years.

- Technologies in Smart Agriculture are improving, and new technologies are being introduced everyday.

- Smart agriculture research is very challenging as involves diverse form of life (plant, animal …) and stake holder (farmer, engineers, distributor, insurance …).

- Having A-CPS with limited network connectivity and power supply is challenging.

- Educating farmers is the main challenge.

- Not many years far from realizing dream of hunger free society.

Smart Agriculture - Prof./Dr. Saraju Mohanty

Future Research

- Research in educating farmers with technology usage.

- Efficient energy consumption techniques as millions of IoT devices will involve.

- Blockchain in transparent chains for increasing consumer awareness and safety.

- Efficient sensors and actuator technologies.

- Big data analytics and AI methods.

- Communication and Connectivity Technologies

- Secure and privacy compliance approaches.

Smart Agriculture - Prof./Dr. Saraju Mohanty
